Cast Iron Machining Solutions

Your Trusted Expert for Cast Iron Machining Solutions

FLITZEN KERAMIK

Safety instructions for using ultra hard cutting tools

1. Instructions for using ultra hard cutting tools

As required by the laws concerning Product Liability enforced on July 1, 1996, we place warning or caution labels on the packages of applicable FK products. However, each tool body itself bears no detailed safety instructions. Therefore, you are requested to read and understand fully the "Safety instructions for the use of carbide cutting tools" before putting any ultra hard tool materials into use. In addition, we request all relevant staff and operators fully understand these safety instructions prior to use.

2. Basic characteristics of ultra hard tool materials

2-1. Meaning and classifications of terms used in this leaflet

Ultra hard tool materials: The collective name for materials used as cutting tools, including carbides, ceramics, CBN and diamond (PCD) sintered materials.

Carbide: Tool materials where the main component is WC (Tungsten Carbide)

Ultra hard materials: The collective name for materials used as ultra hard tools. Also used as a convenient way of referring to carbides under a narrower definition.

Ultra hard tools: The collective name for tools using ultra hard tool materials.

2-2. Physical properties

Appearance: Varies depending on the material. Example: gray, black or gold

Odour: No odour

Hardness: Cemented carbide: HV500 up to 3,000 kg/mm²

Specific gravity: Carbide: 9 up to 19

2-3. Constituents

Carbide, nitride, carbo-nitride, or oxidized materials of W, Ti, Al, Ta, B or the like; some contain metallic components such as Co, Ni, Cr and/or Mo.

3. Precautions for handling ultra hard tool materials

- * One of the properties specific to these materials is high hardness, another is brittleness. Therefore, shock loads or impacts, or excessive clamping of these materials may result in breakage or other damage.
- * As the specific gravity (density) of these materials is very high, a large component made up of these materials or such products in large quantity should be handled with care.
- * Ultra hard materials are different in their thermal expansion ratio from metals. These products are prone to thermal shock and subsequent breakage when subjected to sudden increase or decrease in temperature.
- * As cutting oil, lubricant and general moisture may corrode ultra hard materials and affect their strength, pay extra attention to storing them in good conditions.

4. Precautions for processing ultra hard tools

- * The strength of ultra hard tools may be significantly lowered depending on the surface condition. Always use diamond grinding wheels for finish machining.
- * Dust is produced when ultra hard tools are ground. Install appropriate ventilation/disposal equipment and wear protective gear such as masks, as inhalation of such dust may be hazardous to health. If such dust contacts your skin or comes into contact with your eyes, flush well with flowing water.
- * After the grinding of ultra hard tools or brazed tools, the waste coolant contains components of heavy metals. Be sure to dispose of such waste liquid properly.
- * After re-grinding ultra hard tools, check that they are free of cracks or damage before use.
- * When ultra hard material or products made of ultra hard material is marked with lasers or an electric pen, cracking may occur to the marked area. Do not mark in areas where stress is applied during use.
- * Processing ultra hard material by electric discharge may cause residual cracks on the surface, resulting in lower strength. Thus, remove any cracks completely by grinding as required.
- * Be careful when brazing ultra hard material. If the temperature is lower or higher than the melting point of the brazing material, the insert may not be permanently fixed.

< Precautions for Safe Use of Cutting Tools

Applicable Products	Possible Risks	Safety Measures
General Cutting Tools	< Contact with a sharp cutting edge with bare hands may result in injury.	* Use protective gear s such as protective gloves when taking the tool out of packaging and installing into the machine.
	< Misuse or using under in appropriate conditions may cause the cutting tool to break and/or shatter into pieces, resulting in personal injury.	* Use protective equipment, machine guarding and/or protective glasses. * Use within the range of recommended conditions. Please refer to the instruction manual and catalogue.
	< Sudden increase in cutting resistance due to sudden impact load or excessive wear may cause the cutting tool to break and/or shatter into pieces, resulting in personal injury.	* Use protective gear such as protective gloves when taking the tool out of packaging and installing into the machine.
	< High-temperature chips may be produced and long chips may be ejected, resulting in injury and/or burns.	* Use protective equipment, machine guarding and/or protective glasses. * Before removing chips, always stop the machine. Wear protective gloves and use proper equipment for chip removal.
	< The tool and material/work being cut can become very hot. Touching them immediately after use may cause burns.	* Use protective gear such as protective gloves.
	< Sparks, heat generation due to breakage and/or chips during cutting may cause fire.	* Do not use the machine and tools in locations where there are risks of ignition or explosion. * When using water-insoluble cutting oil, fire prevention measures must be implemented.
	< Out of balance machine set ups when used at a high-speed, may cause insert breakage due to excess vibration or chatter, resulting in injury.	* Use protective equipment, machine guarding and/or protective glasses. * Perform a trial-run beforehand to make sure the setup is stable, free of chatter, vibration and abnormal noise.
	< Touching burrs and flashes on machined work may result in personal injury.	* Use adequate hand protection.
Throw-Away Type Tools (With indexable insert)	< In appropriately clamped inserts and/or components may become detached from the machine during cutting, resulting in injury.	* Before installing the insert, clean the seating surface and clamping components so that they are free of debris. * Use the wrench supplied to install the insert and check that the insert and components are securely clamped. Do not use any inserts or components other than the items specified.
	< Excessively tightening with a device such as a pipe extension may cause the insert and/or components to break or detach due to over clamping.	* Do not use tightening devices such as pipe extensions to obtain further torque. Always use the supplied wrench.
	< At a high speeds inserts and/or components may lose clamping pressure due to the loosening effect of centrifugal force. This is very dangerous. Always ensure secure clamping systems and check regularly.	* Use within the range the recommended conditions. Please refer to the instruction manual and catalogue.
Cutters and Rotational Tools	< As cutters have sharp cutting edges, contact with bare hands may result in injury.	* Use protective equipment such as protective gloves.
	< Imbalance or eccentric rotation may cause the tool to break due to vibration or chatter, resulting in potential injury.	* Use at a rotational speed within the recommended conditions. * To prevent eccentric rotation and vibration due to worn bearings, regularly check the machine rotor/rotating parts for the accuracy and balance and adjust as required.
Drills	< Extra care should be taken when through hole drilling as chips may be ejected at high speed as the drill breaks through the workpiece.	* Use protective equipments such as machine guards and/or protective glasses. Additional guarding around the chuck and drill may be advisable.
	< Drill tips of a very small diameter are usually pointed and extremely sharp. Extra care and safety precautions should be taken when handling to avoid puncture wounds.	* Always use precautions and secure safe handling methods. * Wear protective gloves and glasses.
Brazed Inserts / Tools	< Inserts may break or become, detached due to incorrect brazing.	* Use protective equipment such as machine guards and/or protective glasses. Additional guarding around the chuck and drill may be advisable.
Others	< It is not advisable to use repeatedly brazed inserts as the braze may progressively weaken.	* Do not use repeatedly brazed inserts as the strength of such inserts is lowered.
	< Use only for the original and intended purpose. Using outside recommended parameters is very dangerous, causing damages to machines and/or tools.	* Always use and operate as specified, observing the required safety rules and conditions.

Ceramics

FK Ceramic Tools ensure highly efficient machining with their superior high temperature hardness, heat resistance and chemical stability

NTK offers various types of ceramic tool material (silicon-nitride-base, alumina-base and whisker-base) in many different shapes to meet the respective requirements of applications for higher efficiency and at higher cutting speed.

● Alumina-based Ceramics (White ceramics)

Can be used for high-speed finishing of normal cast iron thanks to its excellent wear resistance

● Silicon nitride-based ceramics

Best for high-speed roughing of normal cast iron
Machining up to $v_c = 1,000\text{m/min}$ is possible

● Alumina TiC-based ceramics (Black ceramics)

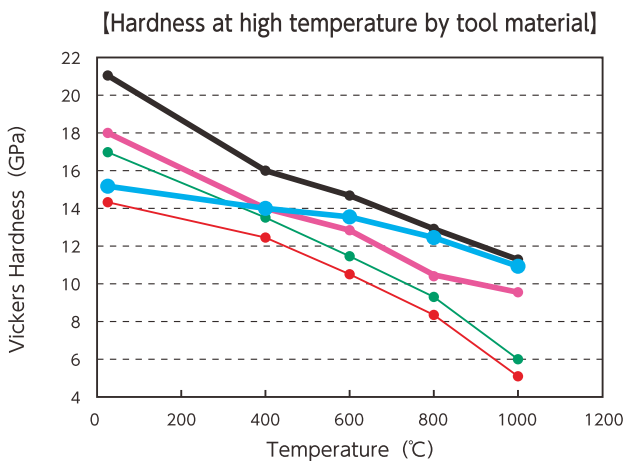

The toughness of this type is improved by adding TiC
Can be used for semi-finishing to finishing for normal cast iron

■ Advantages of ceramic cutting tools①

The material retains high hardness even at elevated temperatures !!

Excellent wear resistance at high cutting speed !

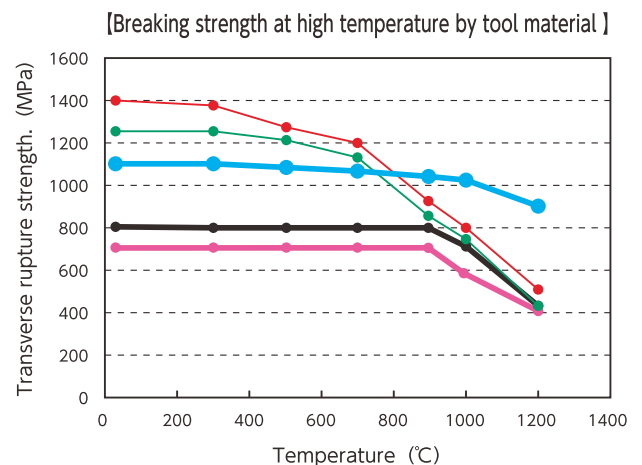

■ Advantages of ceramic cutting tools②

Material breaking strength is not greatly affected by high temperature conditions !!

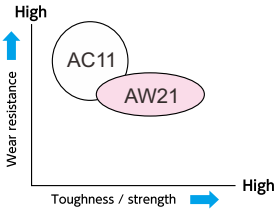

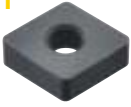

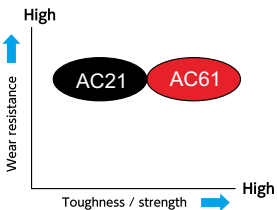

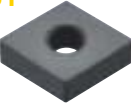

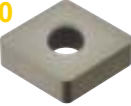

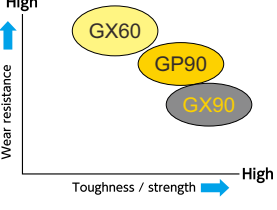

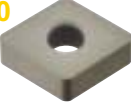

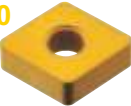

Stable machining is possible in the high speed range

Ceramics

Alumina-based ceramics (White ceramics)

- Characterized by high oxidation resistance as well as deposition resistance, these ceramics utilise alumina that is thermally and chemically stable. They are best suited for high-speed cutting applications where the temperature at the edges may become high.

[Normal cast iron, Finishing, Dry cutting, White ceramic]

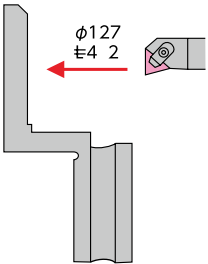

AW21

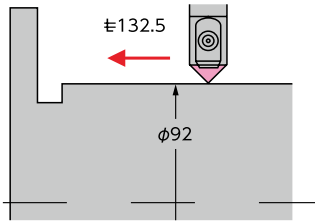

Highly tough alumina-based ceramic tool !

Features

- Exhibits high strength and high toughness through the addition of zirconium to high purity alumina
- Suitable for semi-interrupted finishing applications for normal cast iron and roughing and finishing of special cast iron (such as lining materials)

Brake Disc machining	
Work material : FC250	AW21
Cutting speed (m/min) = 359	
Feed rate (mm/rev) = 0.3	
Depth of cut (mm) = 0.5	
Cutting oil : DRY	
FK: AW21	
Competitor's black ceramic	65 pcs./corner
AW21 achieved twice the tool life of the competitor's product, due to its superior strength.	

Cylinder liner machining	
Work material : special cast iron	AW21
Cutting speed (m/min) = 600	
Feed rate (mm/rev) = 0.32	
Depth of cut (mm) = 3.0	
Cutting oil : DRY	
FK: AW21	
Competitor's black ceramic	30 pcs./corner
AW21 produced finished surfaces of excellent quality in addition to the life being double that of the competitor's product.	

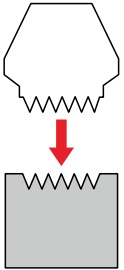

AC11

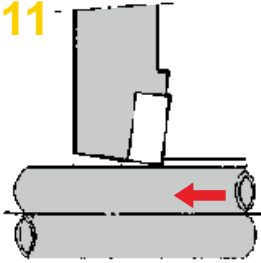

Ideal material for high-speed finishing of cast iron !

Features

- Outstanding wear resistance for high-speed cutting of cast iron, especially semi-finishing or finishing without coolant
- Most suitable for high-speed and high-temperature cutting thanks to the high heat resistance, using high-purity alumina as the main component
- Usable even for finishing of special cast iron and for tube scarfing

Pulley machining		
Work material : FC250	AC11	
Cutting speed (m/min) = 500		
Feed rate (mm / rev) = 0.15 → 0.10 → 0.05		
Cutting oil : DRY		
FK: AC11		600 pcs./corner
Competitor's black ceramic		300 pcs./corner
AC11 achieved double the tool life of the competitor product.		

Tube Scarfing	
Work material : SPHT4	AC11
Cutting speed (m/min) = 70	
Depth of cut (mm) = 3.0	
Cutting width (mm) = 5.0	
Cutting oil : DRY	
FK: AC11	
Competitor's black ceramic	30 min./corner
With its outstanding wear resistance characteristic, AC11 produced double the competitors tool life.	

Ceramics

Alumina TiC-based ceramics (Black ceramics)

This material group are alumina TiC-based ceramics strengthened by adding hard carbide to high-purity alumina. These tool materials exhibit excellent performance in high-speed finishing of cast iron, applications under either WET or DRY cutting, or even in partially interrupted machining, having improved hardness and strength.

- High hardness and low plasticity in high temperature ranges.

[Normal cast iron, Finishing, WET, Black ceramic]

AC21 The standard tool material for machining cast iron and hardened materials !

Features

- **Excellent performance in machining of cast iron and hardened materials thanks to its high hardness and low plasticity in high temperature ranges**

Machining of lining material ● Work material : FC material

	Conventional cutting tool Competitor's carbide	FK AC21
Material grade		
Cutting speed (m/min)	400	600
Feed rate (mm /rev)	0.50	←
Depth of cut (mm)	0.70	←
Cutting oil	DRY	←
Life (pcs./corner)	40	110

AC21

AC21 produced 1.35 times higher machining efficiency and almost 3 times the tool life of the competitor's product.

Machining of roller bearing ● Work material : SNCM (HRC58)

	Conventional cutting tool Competitor's carbide	FK AC21
Material grade		
Cutting speed (m/min)	23	112
Feed rate (mm /rev)	0.06	0.06
Cutting oil	DRY	←
Life (No. of grooves)	4	6

AC21

AC21 produced approximately twice the machining efficiency and 1.5 times longer tool life than the competitor's product.

AC61

For machining of ductile cast iron!

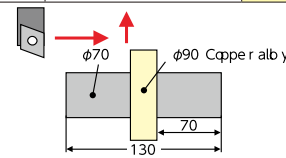

Features

- **World's first TiC-based ceramic put into practical use**
- **Ideal for semi-finishing and finishing of ductile cast iron at low to high-speed levels**
- **Also produces excellent dimension stability in machining of cast iron under WET cutting conditions**

Gear cutting ● Work material : Equivalent to FCD450 + copper alloy

	Conventional cutting tool	FK
Material grade	Competitor's cermet	AC61
Cutting speed (m/min)	300	←
Feed rate (mm/rev)	0.05	←
Depth of cut (mm)	0.5	←
Cutting oil	WET	←
Life (pcs/corner)	20	50

AC61

AC61 produced remarkably long life, less dimensional variations and better wear resistance compared with the competitor's product.

■ Cutting performance : V-T curve

Cutting conditions
 Work material : FCD550(HB240 ~ 260)
 Insert : SNGN120408
 Depth of cut : 0.5mm
 Feed rate : 0.2mm /rev
 Reference life : Amount of VB wear=0.4mm

Ceramics

Silicon nitride-based ceramics

The silicon nitride-based ceramics have approximately twice the fracture toughness of alumina-based, having high fracture resistance equal to some carbide tools. These grades allow efficient machining in high speed ranges where traditional ceramic tools were not able to perform well, including milling of cast iron and interrupted cutting in poor surface conditions.

[Normal cast iron, Roughing]

GX90 Best grade for roughing ductile cast iron

Features

- Excellent notch wear resistance
- Better flank wear resistance compared to competitor's silicon nitride ceramics
- Superior toughness compared to Whisker-reinforced ceramics
- Best thermal shock resistance
- Best grade for roughing Inco 718 with scale

Housing (Ductile Cast Iron)		
Comp. Whisker	GX90	
Shape	CNGN120408	←
Cutting speed (m/min)	180	←
Feed (mm/rev)	0.13	0.2
Depth of cut (mm)	2.5	←
	WET	←
FK: GX90	* High productivity	
Competitor's Whisker ceramic		

GX60 Premium Silicon Nitride

Features

- Excellent wear resistance in applications where notch wear appears
- Stable tool life in the applications where thermal shock resistance is required : such as WET machining or milling
- Long tool life and high productivity at high cutting speed

Brake rotor	
Gray cast iron	
Cutting speed(m/min):1,100	
Feed(mm/rev) : 0.5	
Depth of cut (mm):2.0 ~ 3.0	
WET	
FK: GX60	75 pcs
Competitor's silicon nitride ceramic	50 pcs

GP90 High Speed machining with low cutting forces

Features

- Excellent wear-resistance and chipping resistance with CVD coated high-strength silicon nitride-based ceramic
- Achieves lower tool pressure with minimal edge preparation
- Also usable for finishing

Brake disc	
SG Iron	
Cutting speed (m/min) : 550	
Feed (mm/rev) : 0.4	
DRY	
FK: GP90	120 pcs
Competitor's silicon nitride	80 pcs

High-pressure sintered compact

CBN grade inserts are composed mainly of CBN (Cubic Boron Nitride) particles with a special ceramic binder. The material has excellent cutting material properties including high hardness at normal and highly elevated temperatures, little chemical reactions with work materials, making it a material suitable for cutting tools

CBN inserts can be used for machining of cemented materials and high speed machining of cast iron

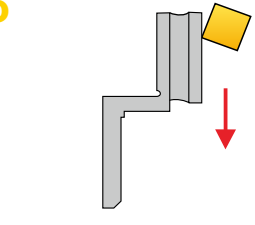

E16

Best for high efficiency machining of cast iron !

【Actual machining examples】

Rough cutting of disc brake

Work material : FC250	
Cutting speed (m/min) = 1,000	
Feed rate (mm/rev) = 0.7	
Depth of cut (mm) = 1.0	
Cutting oil : WET	

FK: E16

800 pcs./corner

Competitor's CBN product

650 pcs./corner

E16 produced tool life of 1.2 times the competitor's product.

Features

- Solid CBN with multiple corners available
- The coating allows easy checking of used cutting edges

Material grade	Main binder	CBN content	Major application
E16	TiN coating + special ceramic	82%	Roughing and finishing of normal cast iron at high speed/rolling rolls

E22

Best for machining of rolls of high hardness !

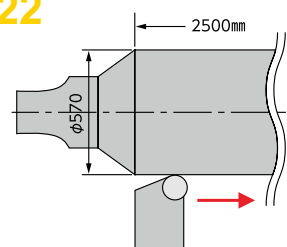

Features

- Top layer of CBN with a carbide base offering multiple cutting edges
- High hardness due to the use of the special binder

Material grade	Main binder	CBN content	Major application
E22	TiN-base	80%	Turning of very hard rolls

Machining of roll

Work material : High chrome cast iron	
Cutting speed (m/min) = 60	
Feed rate (mm/rev) = 0.2	
Depth of cut (mm) = 2.0	
Cutting oil : WET	

FK: E22

2 passes

Competitor's CBN product

1 pass

E22 produces twice the life of the competitor product.

CB³

Brazed CBN inserts offer high performance, low price and versatility !

Features

- Four grades available for different component materials
- Large range for various applications
- Multiple corners on both insert sides contributes to cost reduction

NEW CBN (Cubic Boron Nitride)

• FLITZEN CB³

Material grade	Main binder	CBN content	Major application
E5K *	TiC-base	50%	Continuous to semi-interrupted machining of hardened steels Finishing of ductile cast iron
E52	TiC-base	50%	Finishing of ductile cast iron and continuous machining of highly hardened materials
E23	Ti-base	90%	High-speed semi roughing of cast iron/sintered alloys
E30	Ti-base	95%	High-speed finishing of cast iron

*PVD coating CBN

[Actual machining examples]

Continuous boring on cylinder block

Work material : FC material **E30**

Cutting speed (m/min) = 800

Feed rate (mm / rev) = 0.3

Depth of cut (mm) = 0.1

Cutting oil : WET

FK: E30	800 pcs./corner
Competitor's CBN product	500 pcs./corner

The life of E30 grade inserts was 1.6 times as long as the competitor's product.

Arial Narrow Bolg

Work material : FCD600 **E52**

Cutting speed (m/min) = 350~400

Feed rate (mm / rev) = 0.08

Depth of cut (mm) = 0.2

Cutting oil : WET

FK: E52	60 pcs./corner
Competitor's CBN product	30 pcs./corner

The life of E52 grade inserts was twice that of the competitor product.

Cutting of outer side of oil pump housing

Work material : FC250 **E23**

Cutting speed (m/min) = 250

Feed rate (mm / rev) = 0.2

Depth of cut (mm) = 2.0

Cutting oil : WET

FK: E23	210 pcs./corner
Competitor's CBN product	70 pcs./corner

The life of E23 grade inserts was 3 times as long as the competitor's product.

JCWM

Stable gray cast iron milling with lower cutting force

- Maximizes ceramic insert potential and can mill faster than 1,000m/min

→ 11

JCFM

- Extremely economical as SNGN1204 style inserts with 8 cutting edges can be used
- Capable of producing excellent surface finish, by utilising inserts with chipbreakers and wiper facets

→ 13

NEW

JCTM

- Economical & Multi-Functional
- TNGN 1604 style inserts with 6 cutting edges
- Low Cutting Force

NEW

→ 14

FCI

- Hybrid Milling Cutter with adjustable inserts
- Finishing Cast Iron by using GX60 & E30

NEW

→ 15

OVERVIEW

LNFM

- Offers high efficiency machining due to the multi-blade design and possibility for greater depth of cut
- Offers a reduction in cutting force via our special chipbreaker design

Lead angle

A.R.-4°
R.R.0°

→ 16

APCE / APCS

- Ceramic milling cutter capable of shoulder milling now released
- Accommodates from $\varnothing 20$ up to $\varnothing 250$ cutters

→ 17

→ 17

Milling Cutters

JCWM

- Stable gray cast iron milling with lower cutting force

- Maximizes ceramic insert potential and can mill faster than **1000m/min**

Thanks to lower cutting forces, work piece chipping is reduced
Apply depth of cut up to A_p 6mm

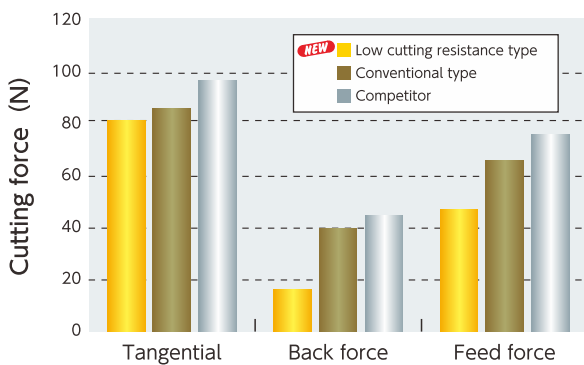

Ceramic with Si_3N_4 is the best choice for roughing cast iron with scale. Tool pressure is reduced because of the sharper cutting edge and the ground-in chipbreaker

Available cutter dia. $\phi 63$ - $\phi 160$

Very cost efficient with a unique 6 cutting edge design

Thanks to low-cutting resistance, machine over load is avoided

【Radius type】

【Chamfered type】

Two edge preparation are available.
Radius type good for high feed milling.
Chamfered type with excellent edge sharpness.

Cutting condition

$V_c=800m/min$ $f_z=0.10mm/t$ $a_p=3.0mm$ $a_e=80.0mm$

Cycle time reduction with single pass and achieve longer tool life.
Lesser machine horsepower required.

As for competitor's milling cutter, we needed to change inserts to new ones due to the wearprogress and lower clamping force of work material after machining 60 pcs. This was caused by increasing Cutting force. Flitzen Keramik New JCWM Cutters achieved 2 times longer competitor's. Low cutting force avoided the problem occurred by competitor's milling cutter.

Milling Cutters

JCFM Cutter

45°, 75°, 88°, 90°
Adjustable Cutter available!

Characteristics:
Negative milling cutter with 45°, 75°, 88°, 90° entering angle. Its strong inserts accept high cutting depths and high feed per teeth. First option for cast iron milling.
